The Algorithm of how the robot will contact and respond to the user

The user will use the application on his phone

The user will use the application on his phone build by using a Tensor Flow that we were building for him

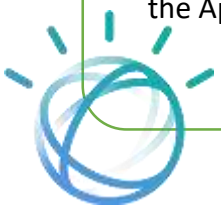
Tensor Flow will do a prediction to what the user speaks (information)

The information of his choice will send to the computer inside the robot

inputs process outputs

Doing change the input information to output by data processing with what kind of skills that we added before into it

Watson assistant in IBM Watson that we build will process the information from the Application inside the computer from the user



The Watson assistant will send the output to the mobile user or as voice response and speech
